Course: Advanced Programming Applications

Sheet: Section - Servlet

Exercise 1:

Create the following form (note: this form has 2 submit buttons)

X

Y

Create a servlet that processes the request and displays the result to the user based on the clicked button

Exercise 2:

Body Mass Index (BMI) is a measure of health on weight. Taking your weight in kilograms and dividing by the square of your height in meters can calculate it. Write a form that prompts the user to enter weight and height. Create a "Calculate" button that invokes a servlet to compute the BMI and detect the user's category.

In the servlet, the BMI is calculated. Based on the result, a category is displayed to the user according to the following table. For example, if the calculated BMI is 27 then the word "Overweight" should be displayed to the user.

Category	BMI	
	from	to
Underweight	0	18.5
Normal (healthy weight)	18.5	25
Overweight	25	30
Obese	30	-
